Sam Joziasse

Are We Ready to Meet the Demand?

Scaling through efficiency

How Bean There Done That turned stability into readiness for scalable, sustainable growth

Key KPIs for Operational Balance and Readiness

Demand-Production Gap

Compares customer orders to actual output

1

Overstock-to-Waste Rate

% of prior month's inventory that becomes scrap, planning misalignment

2

Roaster Utilization

How much of the total capacity is actually being used

3

Inventory Turnover

How fast produced goods are sold and replaced

4

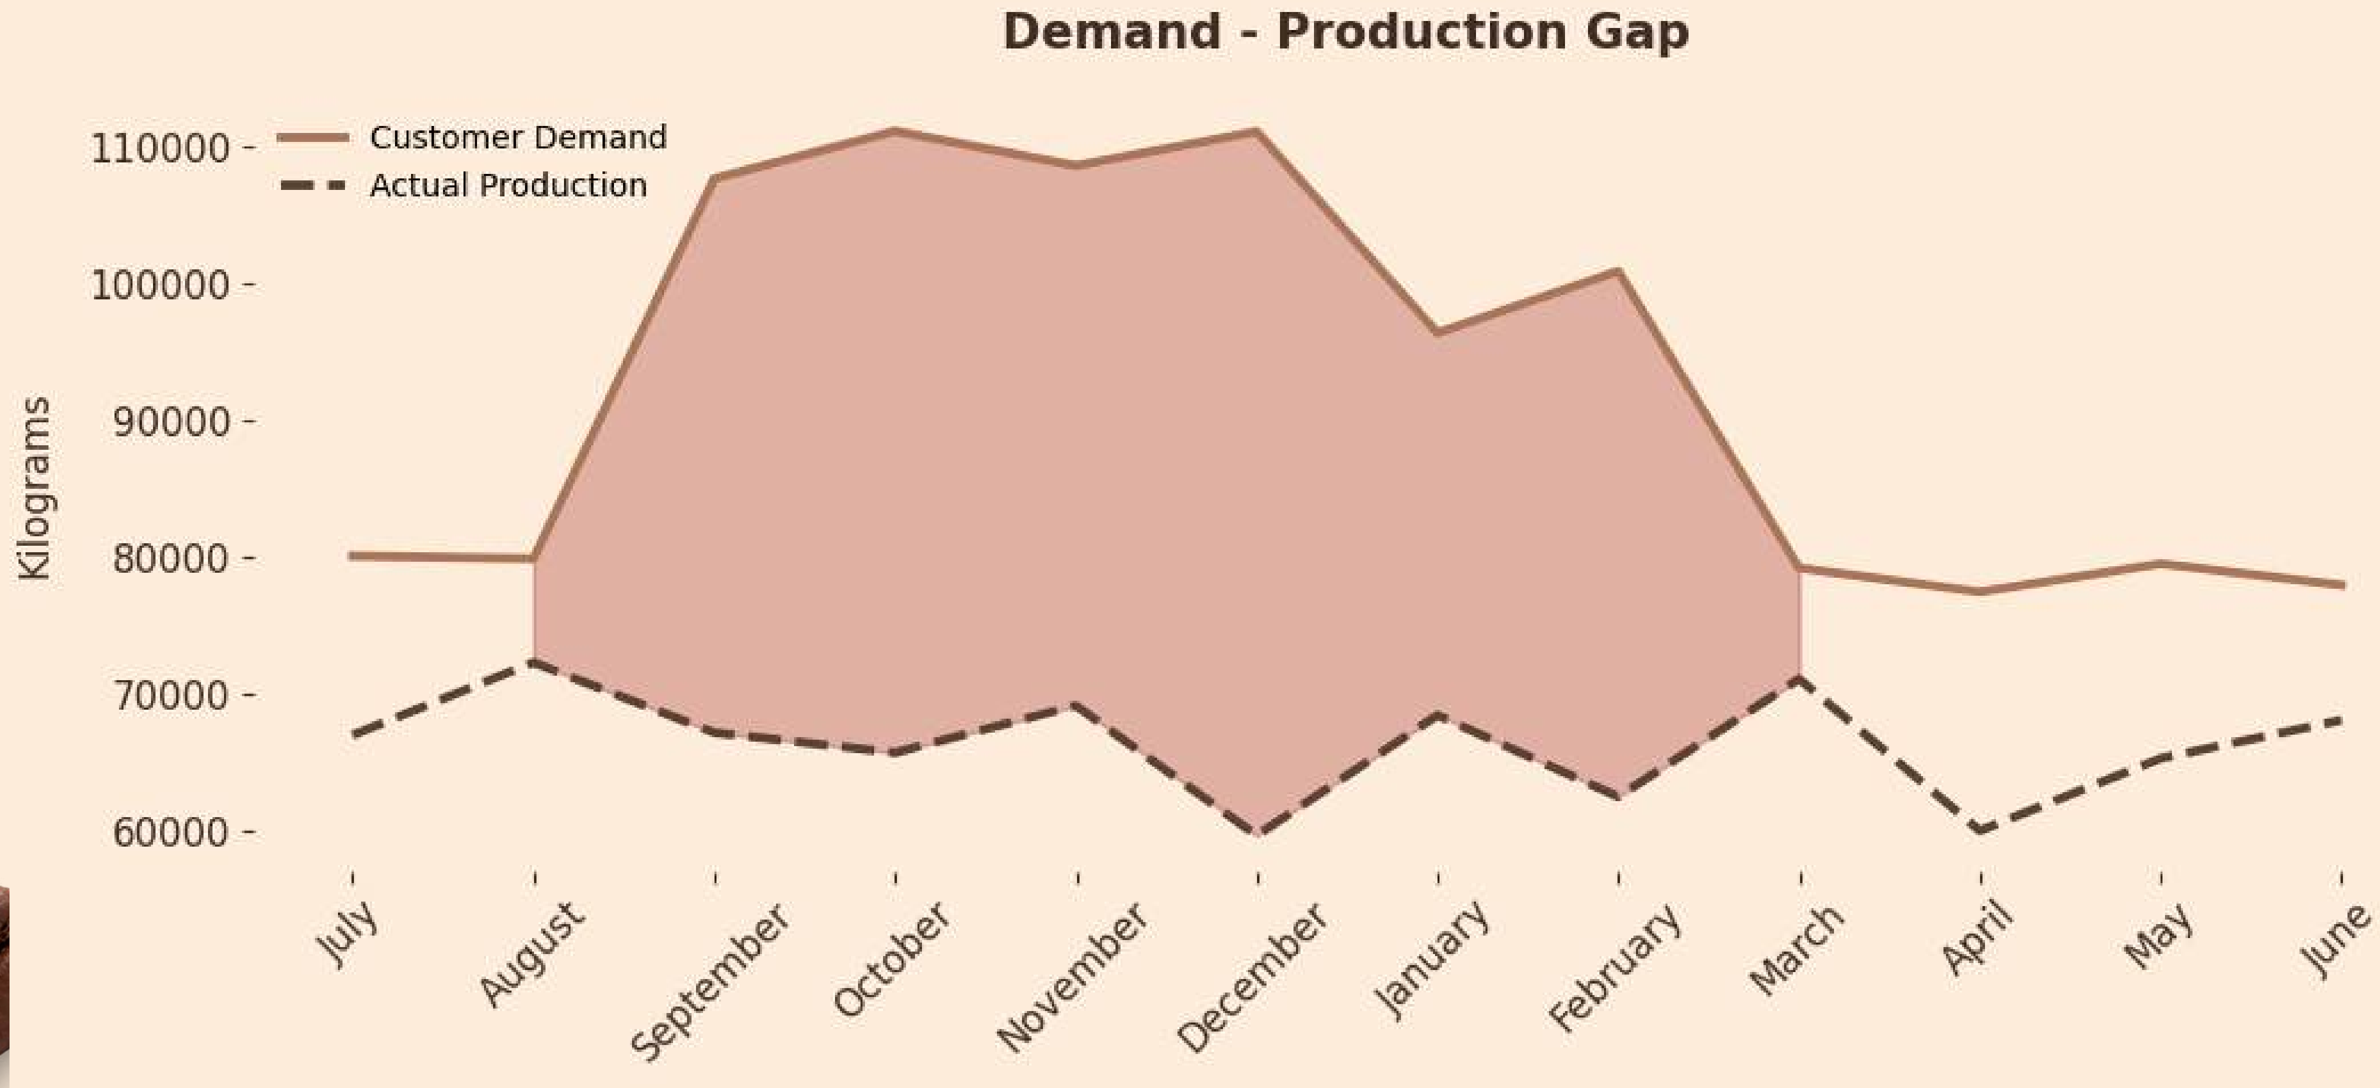
Supplier Reliability

How consistently each supplier delivers compared to their average

5

Demand-Production Gap

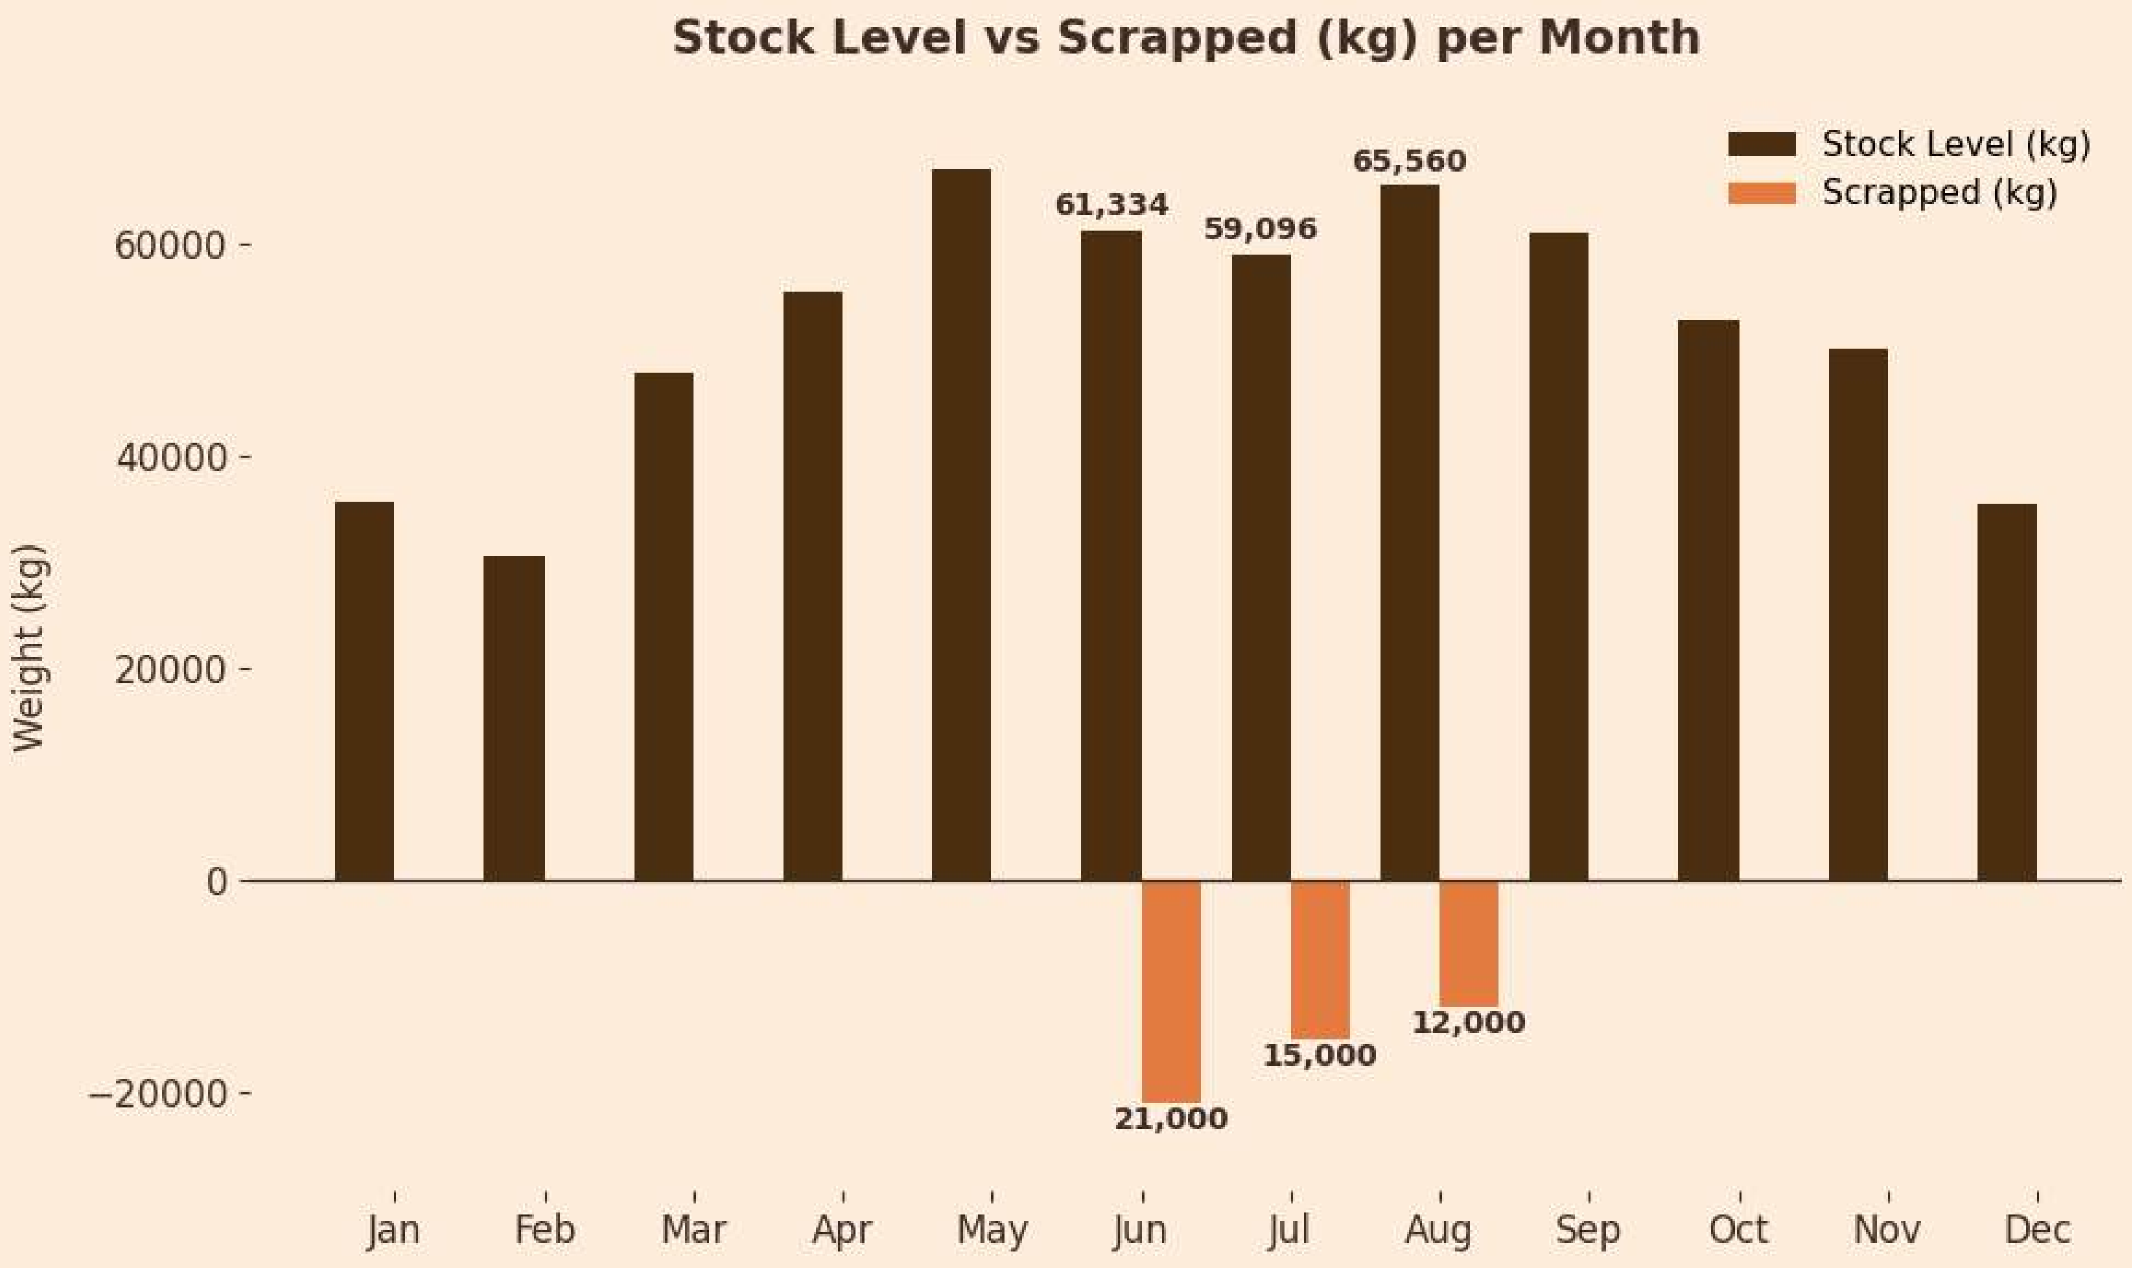
Demand Surges, Production Flat — Growth Stalls



- Demand **peaks** sharply between **August and December**
- Production remains flat, **no scaling with demand**
- Result: **growing backlog** and **unmet orders**
- **Procurement acts reactively**, not strategically
- Each team performed well individually, but **alignment failed collectively**

Overstock-to-Waste Pattern

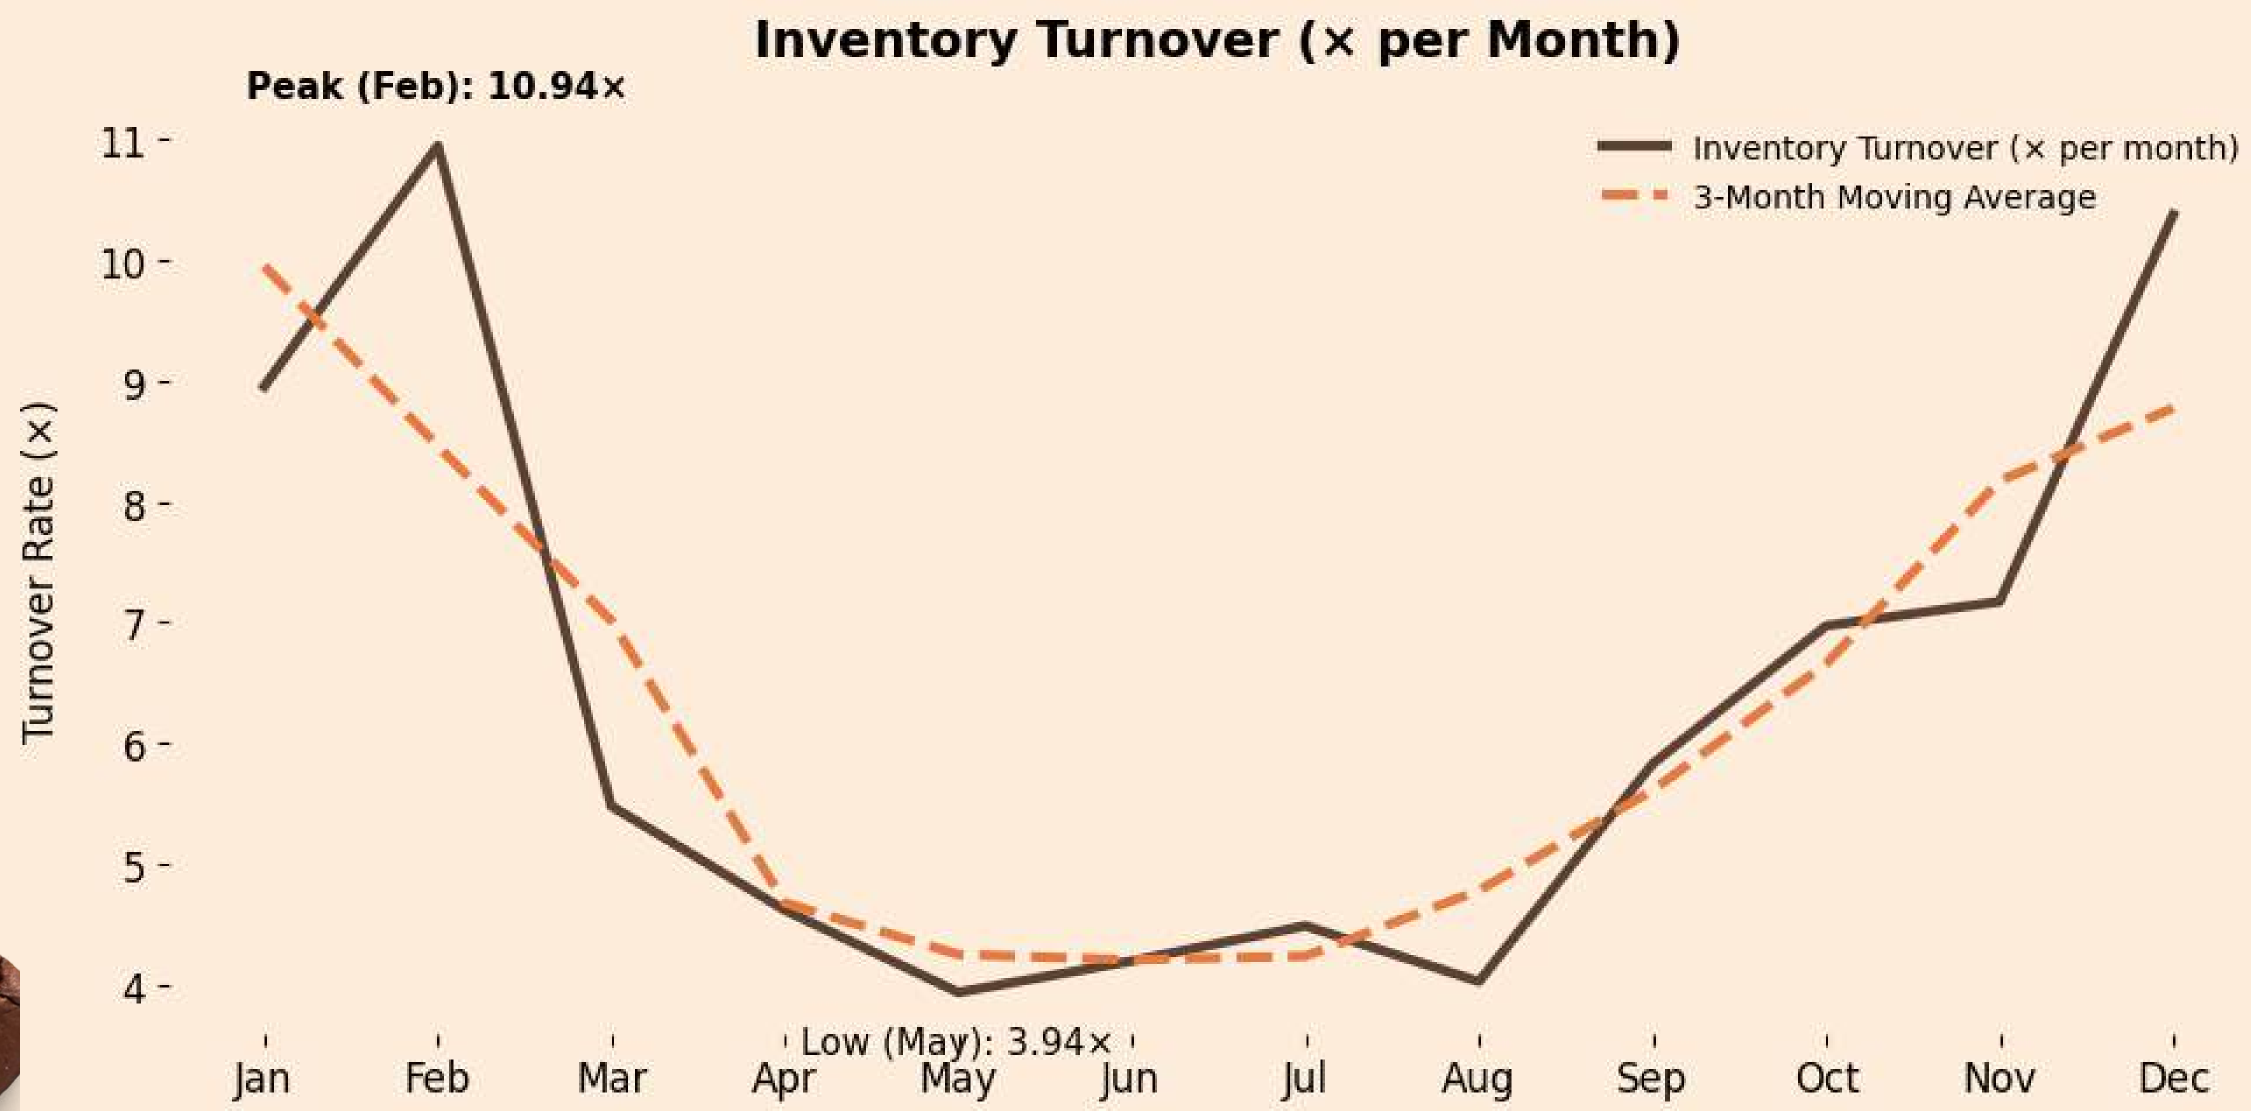
Combined KPI linking inventory build-up and product scrapping



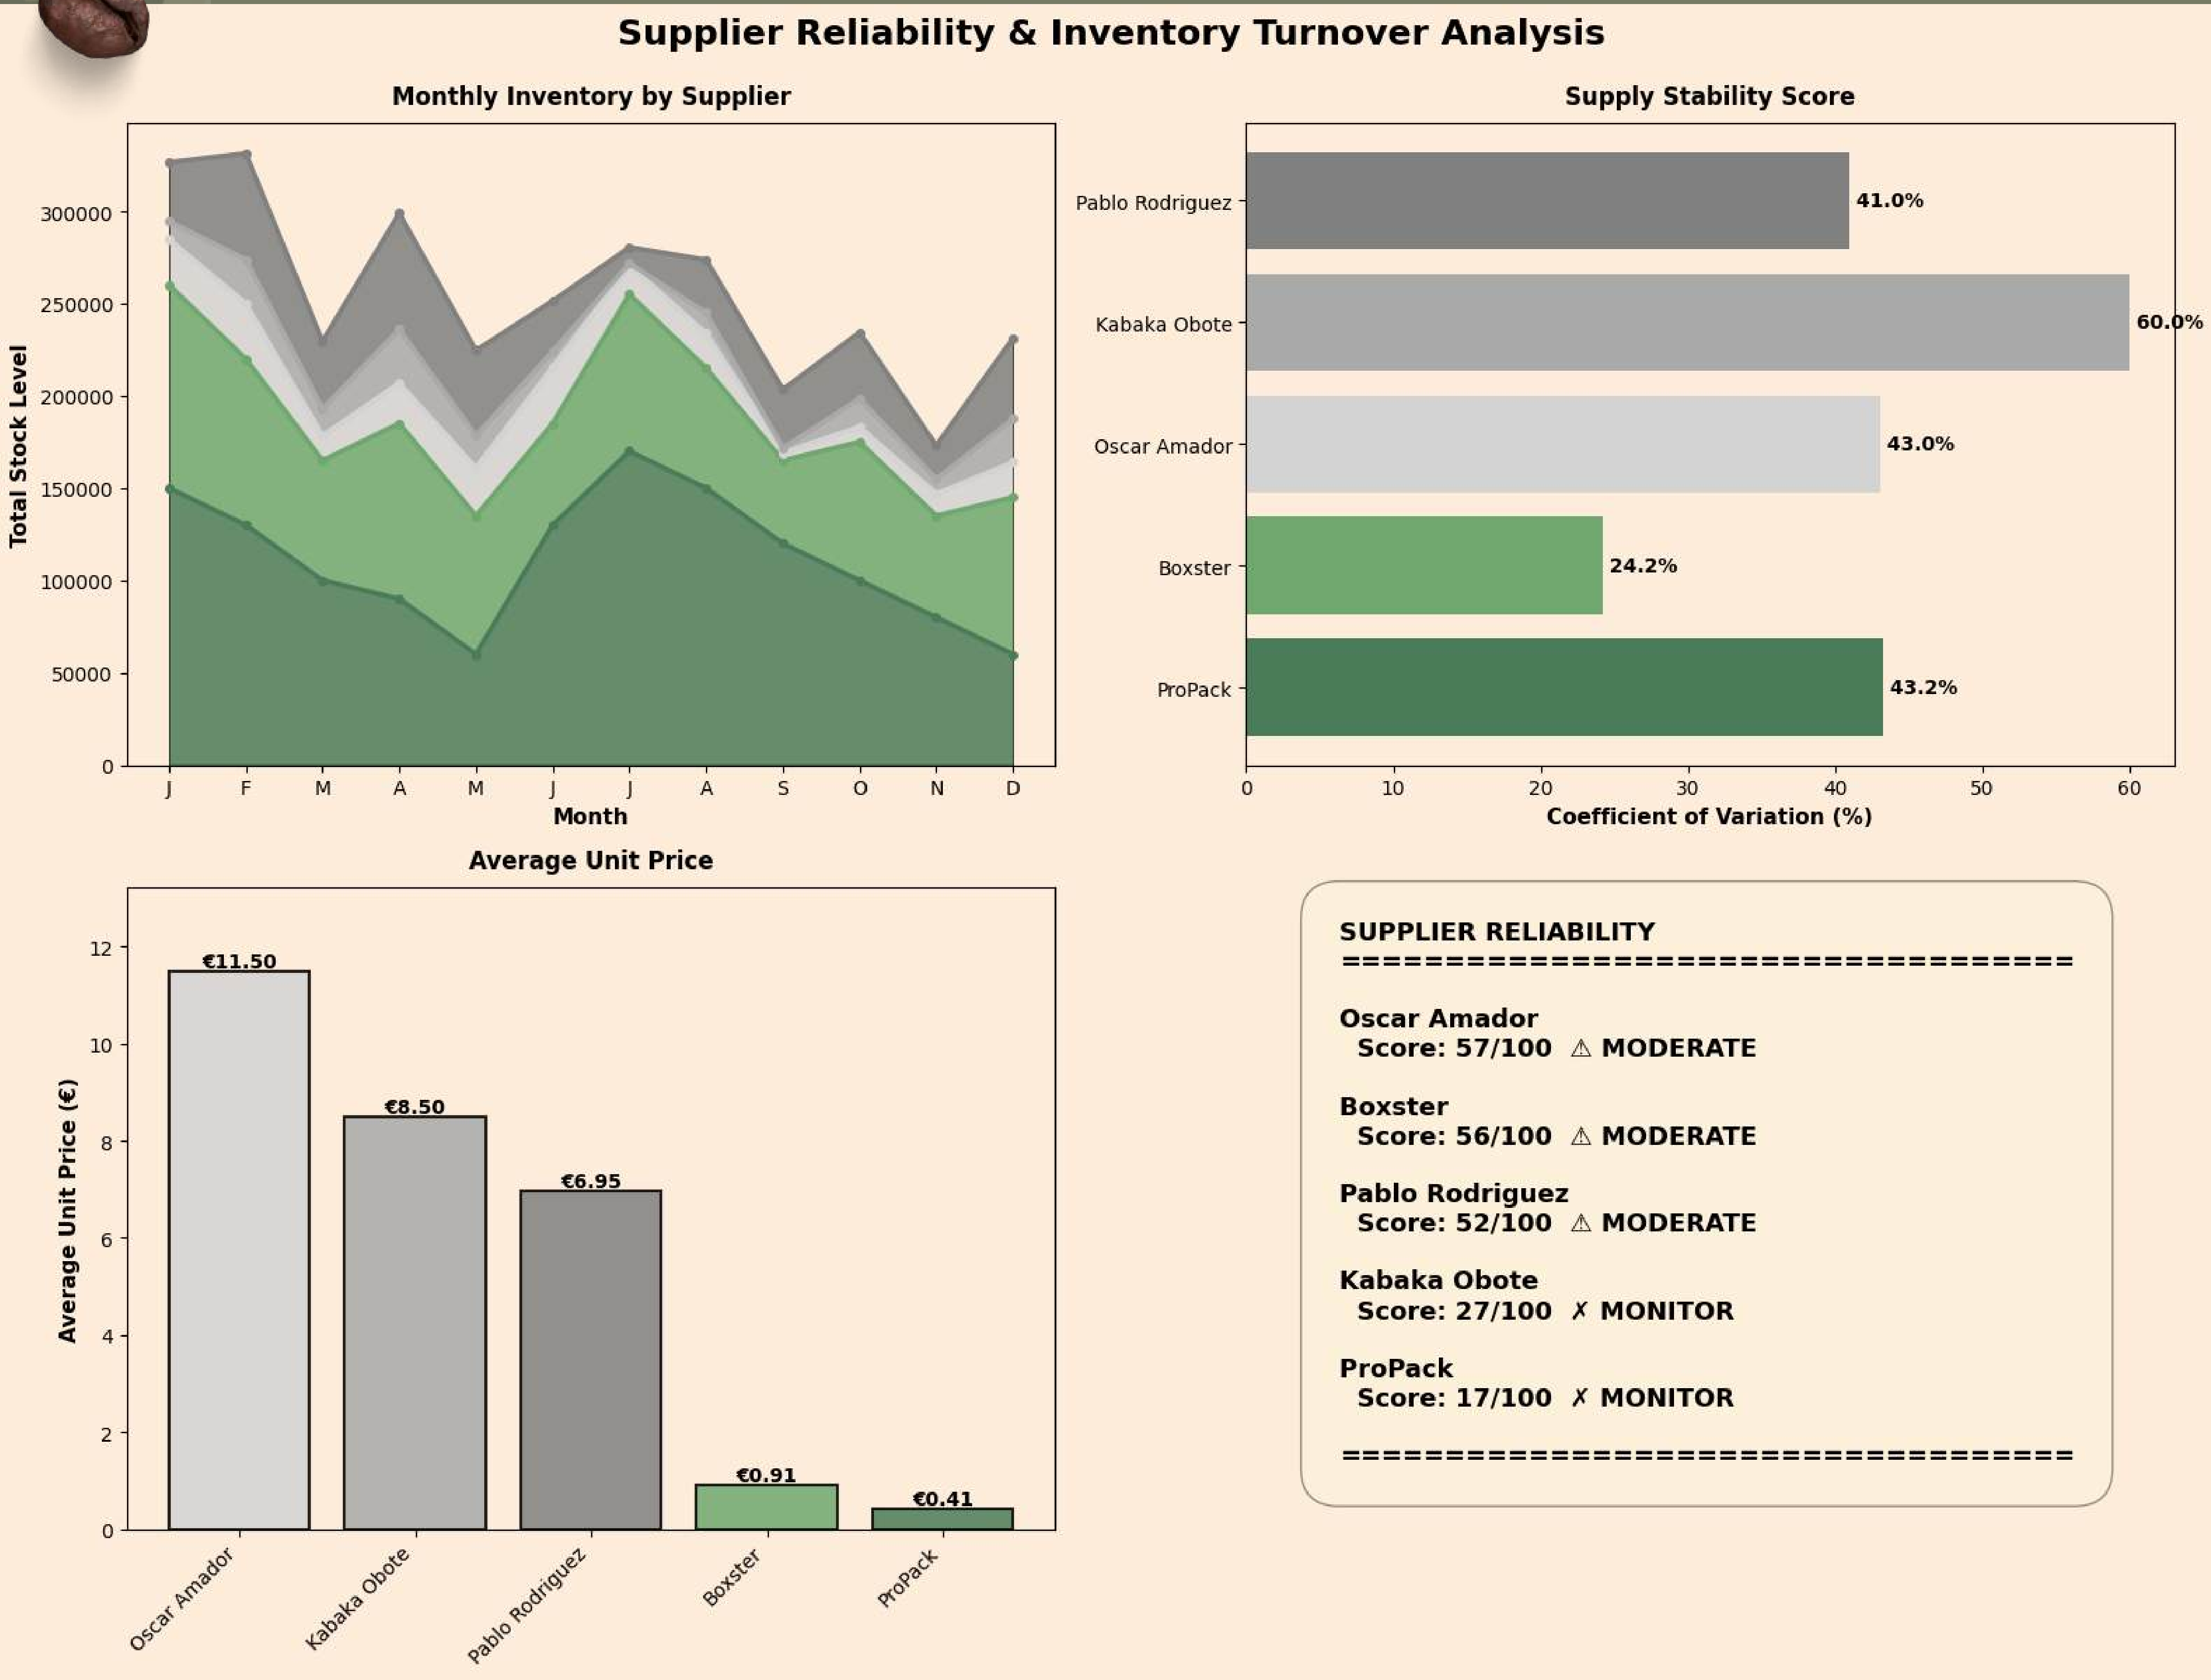
- Peak stock between May–August, reaching **~65 000 kg**
- Scrap volume rises in the same period (**up to 21 000 kg**), mirroring the stock trend
- Pattern indicates **slow inventory turnover and production**–demand misalignment
- Highlights operational imbalance — **efficiency loss grows when output exceeds sales**

Inventory Turnover

Inventory Peaks Despite Steady Production — Cash Locked in Stock



- Turnover dropped from 1**0.9× (Feb) to 3.9× (May)**
- **Stock moves slower** even as production stays steady
- Low turnover = **capital locked in inventory**
- Operational calm hides **financial inefficiency**
- Agility lost — i**nventory inertia takes hold**

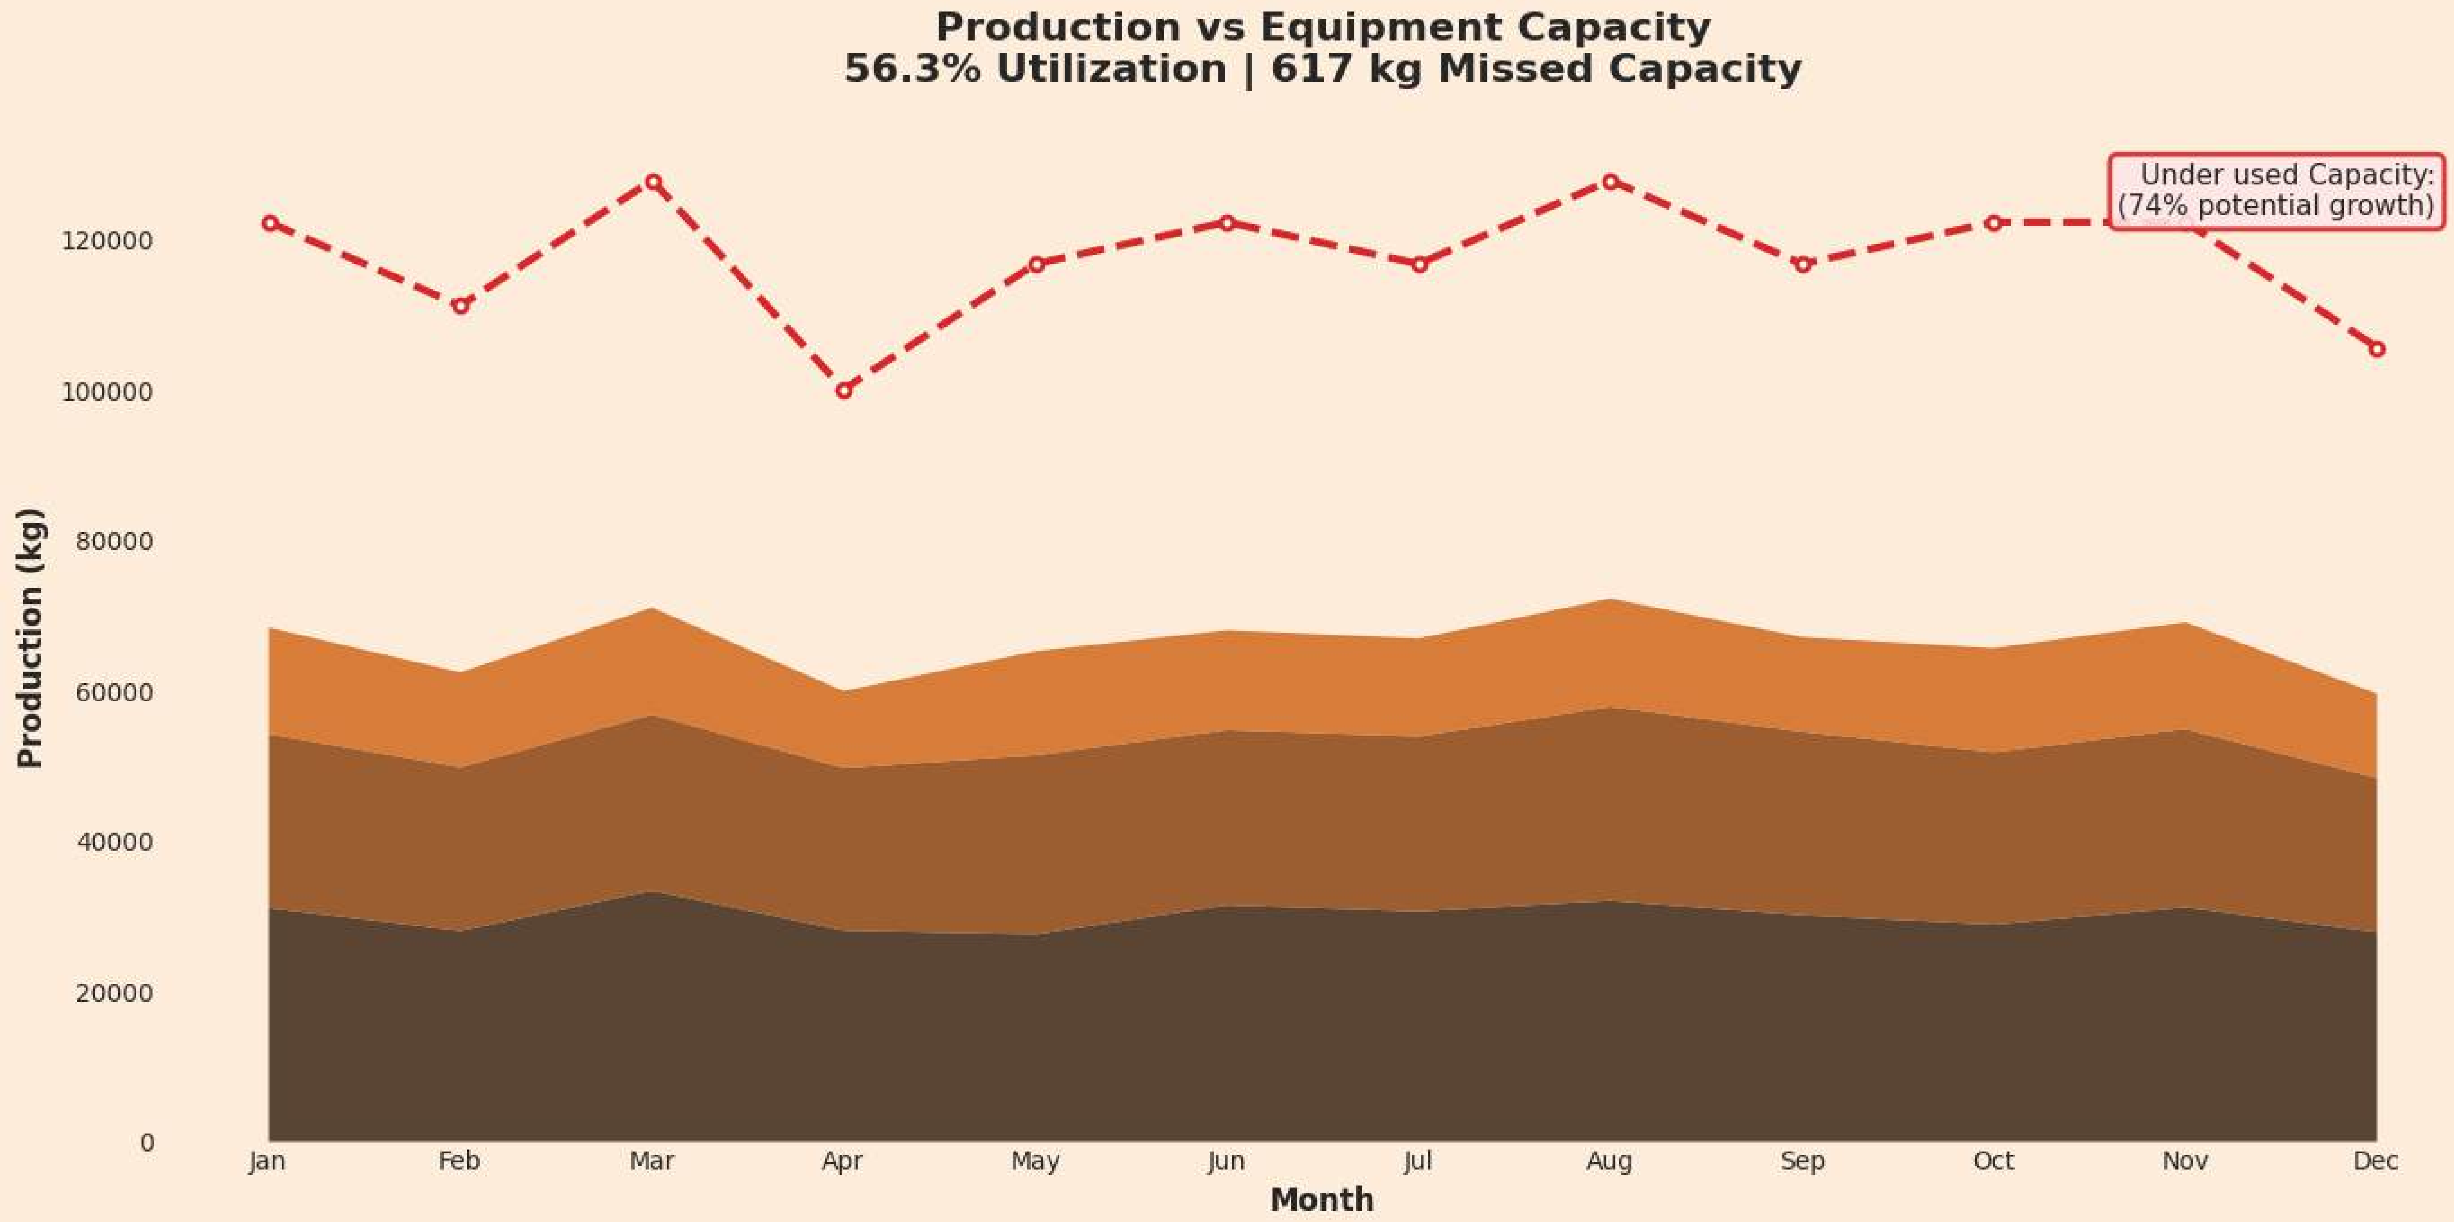


Supplier Reliability

- Supplier variability drives inventory fluctuations
- Bulk or infrequent deliveries create temporary overstock
- Procurement timing is reactive rather than forecast-based

Roaster Utilization

The Capacity to Grow Is Already Here -
Growth potential lies in better coordination, not new machines



- **40% capacity idle** across the year
- Production stays steady despite fluctuating demand → indicates **limited responsiveness**
- Missed capacity: 617 kg/month (**≈ 0.74% potential growth unexploited**)
- High stability, low flexibility: **single-shift roasting limits ramp-up potential**
- Confirms that **growth is constrained by coordination**, not by machine limits

Production Capacity vs. Demand Alignment

Better balance = higher efficiency, lower waste.

Production Capacity Analysis

- 60% average utilization → 40% spare capacity
- Stable output despite fluctuating demand
- Opportunity: ramp up in peak months (Aug–Dec)

Demand & Profitability Insights

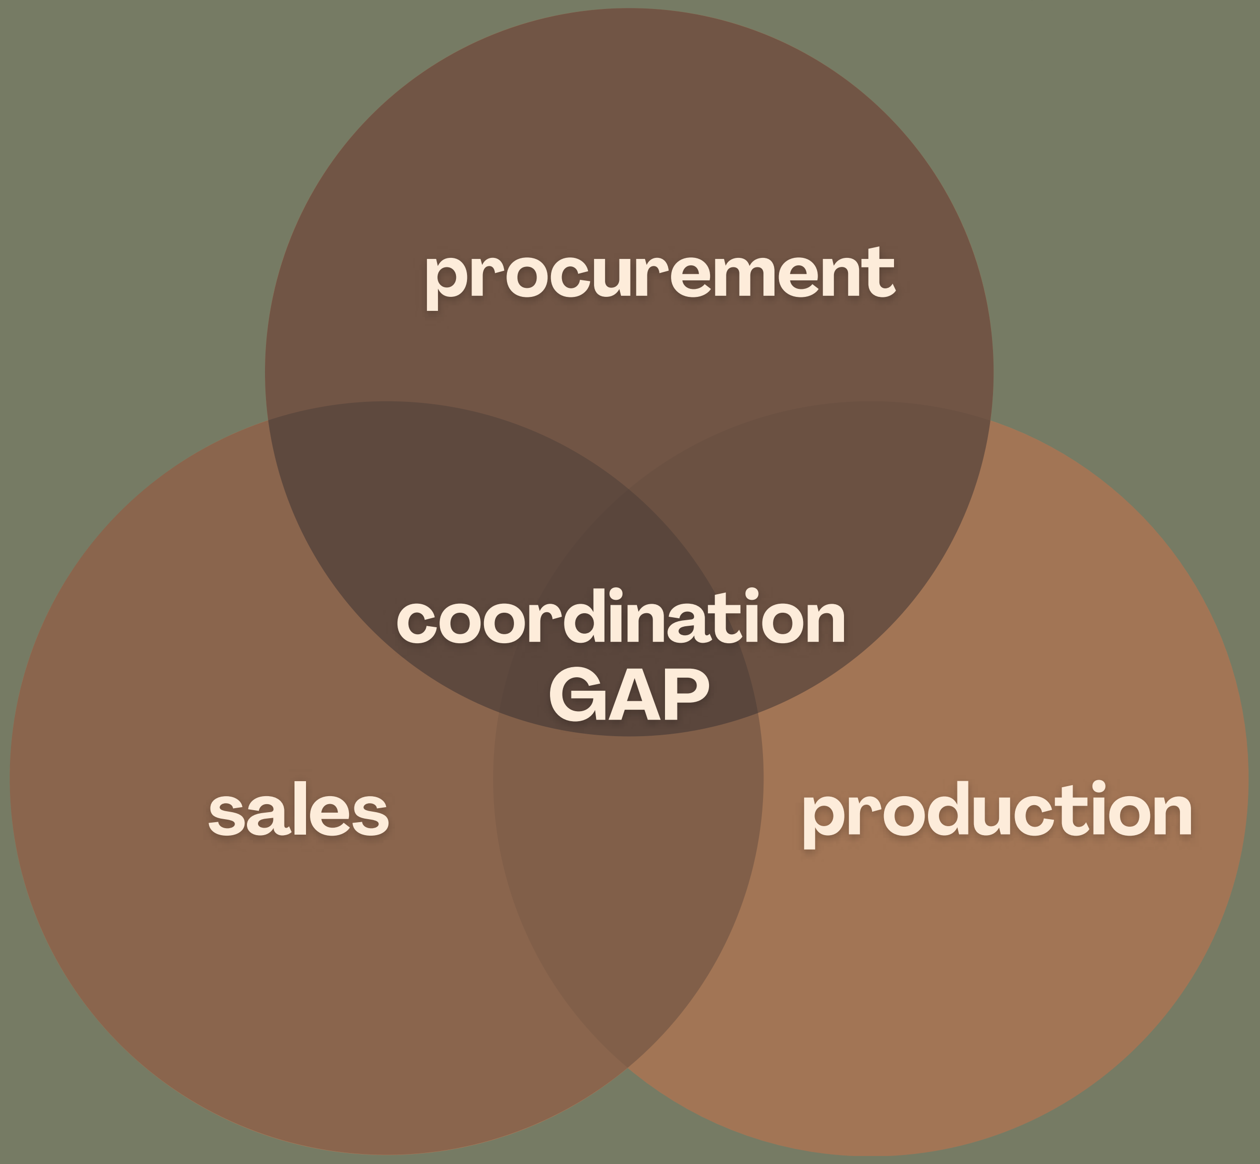
- Rising demand (Aug–Dec) not fully met — production stays flat → missed profit
- High-volume, low-margin products dominate
- Poor demand planning → excess inventory
- Aligning production & demand = clear profit upside

Root causes

Coordination Issues
- Production, sourcing, and sales operate in silos.
- No shared forecasting between departments.

Process Limitations
- Procurement not based on demand projections.
- Supplier timing reactive, not predictive.

Capacity Constraints
- Limited workdays and single-shift roasting reduce flexibility.



From Stability to Readiness

Turning Insights into Action

Focus Area	Action	Expected Impact
Production	Demand-aligned scheduling	Reduce idle time
Inventory	Target turnover & coverage	Free capital, reduces waste
Sourcing	Forecast-based purchasing	Secure supply
Planning	Integrated S&OP process	Enable scalable growth

Evaluation

What does this mean for growth?

01 70% utilization → **30% idle capacity**

02 Scrap peaks cause **5–7% yield loss**

03 **Growing is** possible through coordination and optimized capacity use

04 **No new investment** required for efficiency gains in the supply chain

Recommendations

Ready to Scale Responsibly

Short term

KPI alignment & team visibility. → Stop operational waste

Mid term

Supplier reliability & inventory flow. → Stable growth foundation

Long term

Expand capacity only if sustained demand (+30%). → Scalable, sustainable growth

Thank You
